

# QUALIFY

## YOUR LANES MORE EFFECTIVELY

Are your shipping lanes providing consistent, reproducible results with respect to damage or loss? Are your transportation providers able to control and ensure the condition of your product during transport in light of all the external variables? Are packaging solutions being used properly? **Use CargoSense oversight to help you validate your lane with our detailed Lane Qualification.**

Our Lane Qualification report includes key insights to understand how consistent freight forwarders and 3PL's are following your SOP's. Our Black Box logger captures temperature, light, humidity, barometric pressure, shock and tilt measures during shipment. Report contents include:

### OVERVIEW

CargoSense's high-level synopsis of the lane study.

### SHIPMENT TIMELINE

A tabular summary of key logistics events such as departure / arrival, flight take-off / landing, and loading / unloading.\*

### MEASUREMENT RESULTS

Analyzed data captured by our Black Box loggers to determine max, min, and mean measurements.

### DATA VISUALIZATION

A graphical display of data driven events that surround a product shipment.

We have integrated the industry's top data loggers. We are independent to logger type and can integrate and use your current logger to conduct lane qualification reports.

*\* = Full segmentation of a shipment timeline requires an environmental logger that records temperature, pressure, light, shock, and humidity.*
